

# S-K Environmental Testing

S-K Environmental is always looking for ways to improve the weed wash system to provide the best, effective and efficient prevention tool available. S-K Environmental teamed up with a Chemical Company to run some tests with one of their products to see if there were any advantages. Two farm trucks were selected; a Dodge Dakota representing a low to the ground vehicle and a 4X4 Ford pickup to represent 4-wheel drive vehicle. These vehicles were driven through a solid patch of Diffuse Knapweed and Russian Knapweed patch then processed through the weed wash system. With the coloring added to the weed wash system it is clear the full coverage of the undercarriage of both vehicles from the underbody wash assembly. It was also noted that the tread on the tires; Dakota was new tread and the Ford was old tread, they both were able to collect seeds that could potentially be traveled down the road and deposited to introduce new infestations creating new populations of noxious weeds.
