

# Research Projects

University of Notre Dame

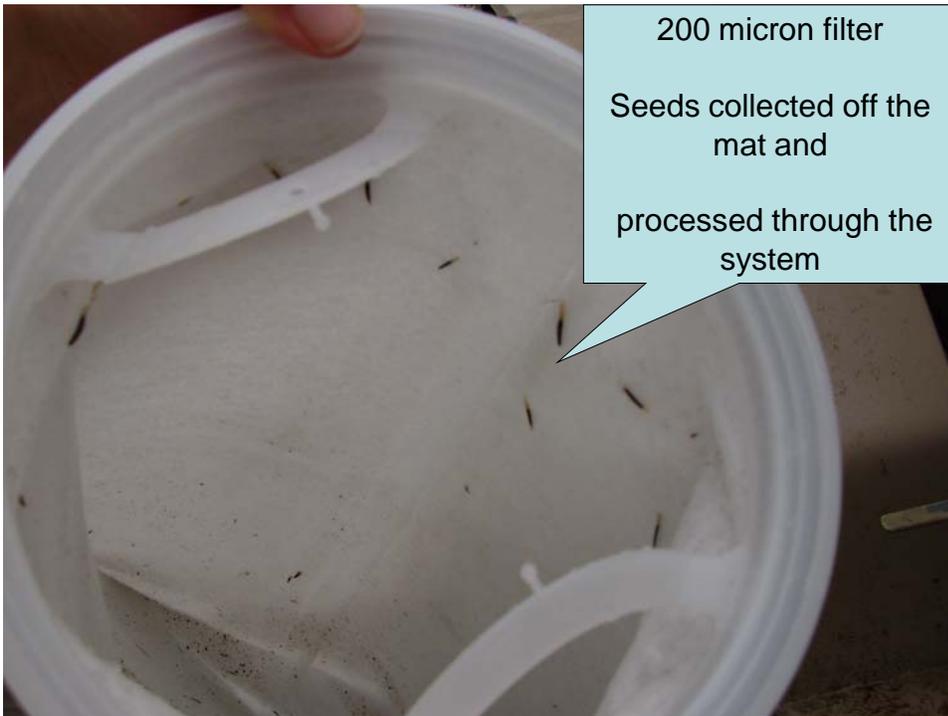

S-K Environmental participated in an aquatic scientific study with the U of ND. The aquatic organisms in the trials were Eurasian Watermilfoil and Spiny Waterflea. These species are rapidly infesting lakes due to the popular recreational fishing throughout all the lakes in this area. Fishing derbys were identified as a possible cause of one of the main spreads. The experiment was led by Dr. David Lodge and John Roghtlisberger. Trials were performed in the university parking lot then we traveled to the upper peninsula of Michigan and Northern Wisconsin, washing off boats and boat trailers during August and September.

# Spiny Waterflea

Milfoil removed from boat and boat trailer.

Local News Station Channel 12.
